## MAKE AN IMPACT!

The Pactiv Air 2000™ bag suspends a product in an inflated pouch of air. This pouch provides protection against damage by reducing shock and harmonic vibration. The product fits snugly in the pocket formed between two inflated double sheets of heavy gauge, coextruded film. The pouch creates an instant, highly protective package. Upon receipt at its destination, the pouch can be pierced to deflate the bag or can be deflated using a straw and then reused. It can conform to a variety of odd-shaped profiles. The pouch takes up minimal storage space until inflated and can significantly reduce packaging time when compared to other cushioning and blocking/bracing techniques.

Prior to inflation, open the pouch and insert product into the bag.

Insert air nozzle into the inflator valve. Inflate bag to full capacity. Do not stretch bag's film, this causes over-inflation.

Remove the white strip from inflator valve then pull the valve over the top of pouch and pressing down firmly.

Place the pouch into a corrugated box or folding carton of similar size.
